

ADITYA DANGE

GAMEPLAY PROGRAMMER | UNITY & UNREAL ENGINE

Mumbai, India • aadi.gamedev@gmail.com • +91-9850809804 • linkedin.com/in/adityadange • github.com/aadigamedev37 • Portfolio

EDUCATION

BCA — Game Development

Ajeenkya DY Patil University, Pune

INDUSTRY EXPERIENCE

GlobalStep — Game Tester Intern
3 Months | 2026

- Executed functional, regression, and build verification testing across daily game builds, identifying and documenting critical gameplay defects.

TECHNICAL SKILLS

Languages

C# C++ Blueprint Scripting

Engines

Unity 6 Unreal Engine 5

Gameplay & AI

Combat Systems

Character Controllers

Procedural Generation

Behavior Trees State Machines

Animation Rigging

Object Pooling

Architecture

Scriptable Objects

Component-Based Design

Event-Driven Systems

Tools

Git GitHub Visual Studio

Blender

PROFESSIONAL SUMMARY

Gameplay Programmer focused on building modular gameplay systems, combat mechanics, AI, and procedural generation in Unity (C#) and Unreal Engine 5. Experienced in designing scalable gameplay architecture while applying professional QA practices to deliver stable, maintainable, and production-ready game systems.

PROJECT VANGUARD — GAMEPLAY SYSTEMS FRAMEWORK

Gameplay Framework — Unity 6, C#

In Development

- Architected a modular weapon framework using Scriptable Objects for data-driven configuration without modifying core logic.
- Designed an object-pooled projectile framework supporting raycast and physics-based hit detection with zero runtime allocation spikes.
- Engineered a versatile player controller utilizing the New Input System and Cinemachine aim-assist for responsive input handling.
- Developed runtime procedural level generation featuring modular rooms, dynamic room stitching, and intelligent spawn systems.
- Integrated procedural animation rigging with IK for real-time weapon aim offsets and procedural recoil.
- Built a scalable health and damage architecture accommodating diverse damage types, resistances, and reactive hit feedback.

Currently Expanding: Enemy AI • Interaction Framework • Mission Systems • Boss Encounters • Advanced Combat

UNREAL ENGINE 5 — GAMEPLAY PROGRAMMING

Multiple Prototype Projects — Blueprints, C++

2025

- Engineered combat prototypes using the Gameplay Framework and Blueprints to process combos, hit detection, and damage logic.
- Developed responsive character controllers featuring custom movement parameters, Coyote-time jumping, and input buffering.
- Built environment systems using Landscape tools, procedural foliage, and dynamic lighting for optimized level blockouts.
- Integrated Sequencer-driven cinematics to manage real-time camera cuts, animation triggers, and seamless gameplay state transitions.
- Implemented data-driven UMG UI systems, binding dynamic health pools and menus directly to core gameplay variables.
